EchoBrief v2

Build Plan — 7-Day Sprint

From Chrome extension to scalable meeting bot — India's first multilingual meeting intelligence platform. A one-week execution plan to ship the bot-based recording engine while keeping the existing Chrome extension live.

Prepared for	OltaFlock AI — internal engineering team
Prepared by	Khush, with Claude AI
Date	March 25, 2026
Repository	github.com/AmaanBarmare/echobrief
Current status	v1 live on Chrome Web Store (extension-based recording)
Sprint goal	Ship bot-based recording alongside existing extension in 7 days
Brand	Warm Ember — Orange 500 (#F97316) to Amber 500 (#F59E0B)

Contents

1. Strategy — Extension + Bot, not Extension vs Bot
2. Brand Identity — Warm Ember
3. Architecture Overview
4. 7-Day Sprint Plan
   Day 1 — Bot foundation + Google Meet join
   Day 2 — Audio capture pipeline + Sarvam streaming
   Day 3 — Insight pipeline integration + dashboard wiring
   Day 4 — Zoom + Teams adapters
   Day 5 — Calendar auto-join + WhatsApp delivery
   Day 6 — Landing page rebrand + extension companion mode
   Day 7 — Load testing, compliance, deploy
5. What Stays from v1
6. Competitive Positioning
7. Tech Stack
8. Risk Register

1. Strategy — Extension + Bot

Key decision: the Chrome extension stays live.
The v1 Chrome extension is already on the Chrome Web Store and working. We do not kill it. Instead, we add a parallel recording path — a server-side bot that joins meetings as a participant. Users get two options: the extension (for people who want zero bot visibility) and the bot (for hands-free, auto-join, multi-platform recording). Both feed into the same Supabase backend and AI pipeline.

Why both?

Extension — Already live, no bot joins the call (stealth mode), Chrome-only, user must be present. Good for individual users who want privacy.

Bot — Auto-joins from calendar, works across Meet/Zoom/Teams, user doesn't need to be present. Good for teams, managers, and enterprise.

Shared backend — Both paths upload audio to the same Supabase storage, trigger the same process-meeting Edge Function, and produce insights in the same schema.

The dashboard shows a 'Recording source' badge on each meeting — either 'Chrome Extension' or 'Bot' — so users always know how a recording was captured. The extension popup gets a new 'Or let the bot handle it' link that triggers a bot dispatch for the current meeting URL.

2. Brand Identity — Warm Ember

EchoBrief adopts the Warm Ember brand direction — an orange-to-amber palette that is unique in the meeting intelligence space. No competitor uses this color family, making EchoBrief instantly recognizable.

LOGOMARK

Concentric sound ripples emanating from a center point. Three rings: outer (faintest — raw sound), middle (stronger — transcription), solid center (distilled insight). Orange 500 to Amber 500 gradient.

WORDMARK

"echo" in neutral text + "brief" in Orange 400/600. Font: Outfit SemiBold (600) for the wordmark. The lowercase treatment keeps it approachable. Minimum size: 120px wide.

COLOR PALETTE

Role	Name	Hex	Usage
Primary	Orange 500	`#F97316`	Brand anchor, CTAs, logo gradient start
Accent	Amber 500	`#F59E0B`	Gradient end, hover states
Links	Orange 400	`#FB923C`	Interactive elements, highlights
Dark accent	Orange 900	`#7C2D12`	Text on orange backgrounds
Background	Stone 950	`#0C0A09`	App background (dark mode default)
Cards	Stone 800	`#292524`	Card surfaces, sidebar
Text primary	Stone 50	`#FAFAF9`	Headings, body text on dark
Text secondary	Stone 400	`#A8A29E`	Descriptions, metadata
Success	Green 500	`#22C55E`	Recording active, completed
Error	Red 500	`#EF4444`	Stop recording, failures
Info	Blue 500	`#3B82F6`	Processing, transcribing
AI / Insights	Purple 500	`#A855F7`	AI-generated content badges

TYPOGRAPHY

Role	Font	Weight	Size
Headings	Outfit	600 SemiBold	24–48px

Body	DM Sans	400 Regular	14–16px
Code / data	JetBrains Mono	400 Regular	13px
Indic fallback	Noto Sans [script]	400 / 500	16px minimum

Tagline: "Your meetings, finally useful."

3. Architecture Overview

v2 adds a server-side bot recording path alongside the existing Chrome extension. Both paths converge at the same Supabase backend. The architecture has two recording engines feeding one processing pipeline.

Recording path A — Chrome extension (existing)
Tab Capture API, Offscreen Document, MediaRecorder, WebM upload to Supabase Storage. User must be present. Chrome-only. No bot joins the call.

Recording path B — Meeting bot (new)
Playwright headless browser joins as 'EchoBrief Notetaker'. PulseAudio virtual sink captures audio. ffmpeg streams to Sarvam. Works across Meet, Zoom, Teams. User does not need to be present.

Bot orchestrator
BullMQ + Redis job queue. Docker containers per meeting. Health monitoring, auto-cleanup, scaling. Calendar auto-join scheduler dispatches bots 2 minutes before events.

AI processing layer (shared)
Sarvam Saaras v3 streaming STT (22 Indian languages, code-mixing, diarization) with OpenAI Whisper fallback. GPT-4o-mini insight generation. Sarvam Translate for multilingual summaries.

Delivery layer (shared)
Dashboard (Supabase Realtime), Slack (Block Kit), Email (Resend), WhatsApp Business API (Gupshup/Twilio). Summaries in user's preferred language.

Platforms: Google Meet + Zoom + Microsoft Teams

Languages: 22 via Sarvam Saaras v3 — Hindi, Tamil, Telugu, Bengali, Marathi, Kannada, Malayalam, Gujarati, Punjabi, Odia, English (Indian) + 11 more. Native Hinglish/Tanglish code-mixing.

4. 7-Day Sprint Plan

Sprint philosophy: ship fast, iterate.
Each day has a clear deliverable that is independently testable. The bot path is additive — the existing extension keeps working throughout. If any day's work slips, the product still functions with whatever was completed the day before.

Day 1

Bot foundation + Google Meet join | Owner: Amaan (CTO)

Playwright service scaffold
Node.js/TypeScript project. Dockerfile with Chromium + PulseAudio + ffmpeg. Basic Express API endpoint: POST /join with meeting URL and display name.

Google Meet join automation
Playwright navigates to meet.google.com URL, enters 'EchoBrief Notetaker' as name, clicks join. Handle waiting room, mic/camera dismiss, and 'Ask to join' states.

Docker container lifecycle
One container per meeting. Docker API for create/start/stop. Cleanup on meeting end or timeout (max 3 hours).

Supabase integration
Create meeting record on bot join. Update status via Supabase client. New 'recording_source' column: 'extension' or 'bot'.

End of Day 1 deliverable
A bot that can join a Google Meet URL via API call and appear as a participant. Meeting record created in Supabase.

Day 2

Audio capture + Sarvam streaming | Owner: Amaan (CTO)

PulseAudio virtual sink
Route Chromium tab audio to virtual sink inside the Docker container. ffmpeg captures the audio stream as PCM/WebM.

Sarvam streaming STT
Connect to Sarvam Saaras v3 streaming API. Send audio chunks in real-time. Receive transcription with automatic language detection and speaker diarization.

Real-time transcript storage
Stream transcript segments to Supabase as they arrive. Dashboard can subscribe via Realtime to show live transcription.

Whisper fallback
If Sarvam stream fails, buffer audio and fall back to Whisper batch upload (existing v1 path).

End of Day 2 deliverable
Bot captures meeting audio and produces real-time multilingual transcription via Sarvam streaming. Transcript visible in dashboard during the meeting.

Day 3

Insight pipeline + dashboard wiring | Owner: Amaan + Khush

GPT-4o-mini insight generation
When meeting ends, feed full diarized transcript to existing GPT-4o-mini prompt. Generate structured JSON: executive summary, action items, decisions, risks, timeline, metrics.

Sarvam Translate integration
After English insights are generated, pipe through Sarvam Translate API. Store translated summaries keyed by language code.

Dashboard updates
Add 'Recording source' badge (Extension / Bot) to MeetingCard. Add language selector for summary view. Add live transcription panel to meeting detail page.

Bot status indicator
New component in dashboard: shows active bots, which meetings they're in, recording duration, health status.

End of Day 3 deliverable
Full end-to-end pipeline working: bot joins → records → transcribes → generates insights → displays in dashboard with multilingual summaries.

Day 4

Zoom + Teams adapters | Owner: Amaan (CTO)

MeetAdapter interface
Abstract platform logic: URL validation, join automation, waiting room handling, end detection, graceful exit. GoogleMeetAdapter already exists from Day 1.

ZoomAdapter
Force web client via URL (?type=1). Handle name input, permission prompts, waiting room. Test with free and paid Zoom accounts.

TeamsAdapter
Handle Microsoft account auth, lobby admission, Teams-specific UI states. Test with personal and org accounts.

Auto-detect platform
Parse meeting URL to determine platform. Route to correct adapter automatically. Support meet.google.com, zoom.us, teams.microsoft.com patterns.

End of Day 4 deliverable
Bot can join and record meetings across all three platforms. Platform auto-detected from URL.

Day 5

Calendar auto-join + WhatsApp delivery | Owner: Khush + Amaan

Calendar auto-join scheduler
Extend existing Google Calendar sync. Cron job checks upcoming events every minute. Dispatch bot 2 minutes before meetings with video call URLs. Respect private/tentative events.

WhatsApp Business API
Integrate via Gupshup or Twilio. Message template for meeting summaries. Support regional language summaries. User links their WhatsApp number in settings.

BullMQ job queue
Replace direct Docker API calls with queued jobs. Retry logic, concurrency limits, dead letter queue for failed joins.

Notification preferences
Settings page: choose delivery channels per meeting (Slack / WhatsApp / email), preferred summary language, detail level.

End of Day 5 deliverable
Zero-touch recording: user connects calendar, bot auto-joins. Summaries delivered to WhatsApp in regional languages.

Day 6

Landing page rebrand + extension companion mode | Owner: Khush + Vineet

Landing page deploy
Deploy the Warm Ember branded landing page. Update copy to reflect both extension and bot modes. Highlight 22 Indian languages and WhatsApp delivery.

Dashboard rebrand
Swap the existing purple (#7C3AED) theme to Warm Ember. Update all accent colors, button styles, status badges to new palette. Apply Outfit headings + DM Sans body.

Extension companion mode
Add 'Let the bot handle it' button in extension popup — dispatches bot for current meeting URL. Show live bot transcript status in extension. Extension keeps its own recording capability.

Social media kit deploy
Update LinkedIn, Twitter/X, and all social profiles with new Warm Ember branding assets.

End of Day 6 deliverable
Full Warm Ember rebrand live across landing page, dashboard, extension, and social profiles.

Day 7

Load testing, compliance, deploy | Owner: Full team

Load testing
Spin up 10 concurrent bot containers. Verify memory usage (~512MB/bot), audio quality, transcript accuracy across platforms. Test with Hindi, Tamil, and code-mixed meetings.

Consent handling
Bot posts 'This meeting is being recorded by EchoBrief' in meeting chat on join. Configurable per-org. Clear display name visible in participant list.

Error handling hardening
Circuit breakers for Sarvam/OpenAI. Graceful degradation: if bot fails, notify user to use extension. Auto-retry for transient failures.

Production deploy
Deploy bot service to cloud (AWS ECS or GCP Cloud Run). Deploy updated dashboard and landing page to Vercel. Update Chrome extension on Web Store.

End of Day 7 deliverable
Production-ready v2 handling 10+ concurrent meetings, with consent, monitoring, and fallbacks. Both extension and bot paths live.

5. What Stays from v1

The bot path is additive. The existing v1 codebase stays intact and continues working. Here is what carries forward unchanged:

Chrome extension — Stays on the Chrome Web Store. Tab Capture recording continues to work. Gets a new 'dispatch bot' button but all existing functionality is preserved.

React dashboard — All 14 components reused. Gets Warm Ember rebrand, live transcription panel, bot status widget, and recording source badges.

Supabase schema — meetings, transcripts, meeting_insights, action_item_completions tables unchanged. New columns: recording_source, preferred_language. New tables: bot_jobs, whatsapp_messages.

AI insight pipeline — GPT-4o-mini structured JSON prompt unchanged. Receives transcripts from either extension upload or bot stream.

Sarvam integration — Deepens from batch-only to batch + streaming. Webhook callback pattern preserved. Sarvam Translate added.

Google Calendar OAuth — Full PKCE flow, token refresh, event sync reused. Extended with auto-join scheduling.

Slack + email delivery — Block Kit messages and Resend emails stay. WhatsApp added as new channel.

Auth + RLS — Supabase Auth and Row Level Security policies unchanged.

6. Competitive Positioning

Feature	Fireflies / Otter / Fathom	EchoBrief v2
Indian language STT	Limited. Whisper-based, poor on code-mixed speech	**Sarvam Saaras v3 — 22 Indian languages, native code-mixing, best WER on IndicVoices**
Summary language	English only	**Any of 22 Indian languages via Sarvam Translate**
Recording modes	Bot only	**Bot + Chrome extension (stealth mode)**
WhatsApp delivery	Not available	**First-class channel with regional language support**
Data residency	US/EU servers	**Sarvam sovereign Indian cloud. DPDP compliant**
Pricing	$10–$29/user/month (USD)	**INR pricing. Sarvam STT at ■30/hour**
Platform support	Meet, Zoom, Teams	Meet, Zoom, Teams (bot) + Chrome-only (extension)

7. Tech Stack

Layer	Technology	Purpose
Bot runtime	Playwright + Chromium	Headless meeting join + audio capture
Audio routing	PulseAudio + ffmpeg	Virtual audio sink, real-time stream
Containers	Docker → ECS/Cloud Run	Isolated bot instances, scaling
Job queue	BullMQ + Redis	Scheduling, retries, concurrency
STT (primary)	Sarvam Saaras v3	22 languages, streaming + batch, diarization
STT (fallback)	OpenAI Whisper	English fallback if Sarvam unavailable
Insight gen	GPT-4o-mini	Structured JSON: summary, actions, risks
Translation	Sarvam Translate	Summary in 22 Indian languages
Backend	Supabase	Auth, Postgres (RLS), Storage, Realtime, Edge Functions
Frontend	React 18 + Vite + TS	Dashboard with Warm Ember theme
Extension	Chrome MV3	Tab Capture recording + bot dispatch companion
Delivery	Slack, Resend, WhatsApp API	Multi-channel, multi-language summaries

8. Risk Register

Risk	Likelihood	Mitigation
Platform UI changes break selectors	High	Use ARIA attributes + partial text matching. Daily automated selector tests. Config-based selectors for quick patching.
Bot detection / blocking	Medium	Stealth Playwright plugins. Real Google/Microsoft accounts. User agents rotation. Monitor for CAPTCHAs.
Sarvam API downtime	Medium	Whisper auto-fallback (already in v1). Circuit breaker. Sarvam status monitoring.
7-day timeline too aggressive	Medium	Each day is independently shippable. If Day 4 slips, v2 launches with Google Meet only — still valuable. Zoom/Teams follow in next sprint.
Audio quality in Indian networks	Medium	Sarvam trained on noisy Indian telephony (8kHz, background noise, cross-talk). This is a strength.
Container costs at scale	Low	~512MB RAM per bot. Spot instances. Indian business hours = predictable peaks (9AM–6PM IST).
Recording consent / DPDP Act	Medium	Bot announces itself in chat. Configurable consent banner. All audio on Sarvam's Indian cloud.
Extension + bot confusion for users	Low	Clear 'Recording source' badge in dashboard. Extension popup explains both modes. Settings page has toggle.

EchoBrief v2 — 7-Day Sprint Plan — March 2026
